

Scan Report

December 28, 2024

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Immediate scan of IP 10.0.2.4”. The scan started at Sat Dec 28 15:53:02 2024 UTC and ended at Sat Dec 28 16:13:57 2024 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1	Result Overview	2

2.1.23 Medium 2121/tcp	49
2.1.24 Medium 23/tcp	50
2.1.25 Low 22/tcp	51
2.1.26 Low general/tcp	51
2.1.27 Low 80/tcp	52

Result Overview

Host	High	Medium	Low	Log	False Positive
10.0.2.4	19	34	3	0	0
Total: 1	19	34	3	0	0

Vendor security updates are not trusted.

Overrides are on. When a result has an override, this report uses the threat of the override.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

It only lists hosts that produced issues.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 56 results selected by the filtering described above. Before filtering there were 385 results.

High (CVSS: 10.0) NVT: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities
Summary Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.
Vulnerability Detection Result The service is running in <code>\$SAFE >= 1</code> mode. However it is still possible to run a ↪ arbitrary syscall commands on the remote host. Sending an invalid syscall the service returned the following response: <pre>Flo::Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/druby/druby.rb:1555:in `syscall'"0/usr/lib/ruby/1.8/druby/druby.rb:1555:in `send'"4/usr/lib/ruby/1.8/druby/druby.rb:1555:in `__send__'"A/usr/lib/ruby/1.8/druby/druby.rb:1555:in `perform_without_block'"3/usr/lib/ruby/1.8/druby/druby.rb:1515:in `perform'"5/usr/lib/ruby/1.8/druby/druby.rb:1589:in `main_loop'"0/usr/lib/ruby/1.8/druby/druby.rb:1585:in `loop'"5/usr/lib/ruby/1.8/druby/druby.rb:1585:in `main_loop'"1/usr/lib/ruby/1.8/druby/druby.rb:1581:in `start'"5/usr/lib/ruby/1.8/druby/druby.rb:1581:in `main_loop'"//usr/lib/ruby/1.8/druby/druby.rb:143<0:in `run'"1/usr/lib/ruby/1.8/druby/druby.rb:1427:in `start'"//usr/lib/ruby/1.8/druby/druby.rb:1427:in `run'"6/usr/lib/ruby/1.8/druby/druby.rb:1347:in `initialize'"//usr/lib/ruby/1.8/druby/druby.rb:1627:in `new'"9/usr/lib/ruby/1.8/druby/druby.rb:1627:in `start_service'"%/usr/sbin/druby_timeserver.rb:12:errno+mesg"Function not implemented</pre>
Impact ... continues on next page ...

<p>... continued from previous page ...</p> <p>By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.</p>
<p>Solution</p> <p>Solution type: Mitigation</p> <p>Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:</p> <ul style="list-style-type: none"> - Implementing taint on untrusted input - Setting \$SAFE levels appropriately (>=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and >=3 may be appropriate) - Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts
<p>Vulnerability Detection Method</p> <p>Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.</p> <p>Details: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities OID:1.3.6.1.4.1.25623.1.0.108010 Version used: \$Revision: 12338 \$</p>

NVT: Check for Backdoor in UnrealIRCd

Summary

Detection of backdoor in UnrealIRCd.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Solution

Solution type: VendorFix

Install latest version of unrealircd and check signatures of software you're installing.
--

Vulnerability Insight

Remote attackers can exploit this issue to execute arbitrary system commands within the context of the affected application.
--

The issue affects Unreal 3.2.8.1 for Linux. Reportedly package Unreal3.2.8.1.tar.gz downloaded in November 2009 and later is affected. The MD5 sum of the affected file is 752e46f2d873c1679fa99de3f52a274d. Files with MD5 sum of 7b741e94e867c0a7370553fd01506c66 are not affected.

High 512/tcp

High (CVSS: 10.0)
NVT: rexec Passwordless / Unencrypted Cleartext Login

Summary

This remote host is running a rexec service.

Vulnerability Detection Result

The rexec service is not allowing connections from this host.

Solution

Solution type: Mitigation

Disable the rexec service and use alternatives like SSH instead.

Vulnerability Insight

rexec (Remote Process Execution) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer.

The main difference is that rexec authenticate by reading the username and password *unencrypted* from the socket.

Vulnerability Detection Method

Details: rexec Passwordless / Unencrypted Cleartext Login

NVT: TWiki XSS and Command Execution Vulnerabilities

Product detection result

cpe:/a:twiki:twiki:01.Feb.2003
Detected by TWiki Version Detection (OID: 1.3.6.1.4.1.25623.1.0.800399)

Summary

The host is running TWiki and is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.

Vulnerability Detection Result

Installed version: 01.Feb.2003
Fixed version: 4.2.4

Impact

Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.

Solution

Solution type: VendorFix
Upgrade to version 4.2.4 or later.

Affected Software/OS

TWiki, TWiki version prior to 4.2.4.

Vulnerability Insight

The flaws are due to,

- %URLPARAM% variable is not properly sanitized which lets attackers conduct cross-site scripting attack.
- %SEARCH% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.

Vulnerability Detection Method

High (CVSS: 7.5)

NVT: PHP-CGI-based setups vulnerability when parsing query string parameters from php files.

Summary

PHP is prone to an information-disclosure vulnerability.

Vulnerability Detection Result

Vulnerable url: <http://10.0.2.4/cgi-bin/php>

Impact

Exploiting this issue allows remote attackers to view the source code of files in the context of the server process. This may allow the attacker to obtain sensitive information and to run arbitrary PHP code on the affected computer. Other attacks are also possible.

Solution

Solution type: VendorFix

PHP has released version 5.4.3 and 5.3.13 to address this vulnerability. PHP is recommending that users upgrade to the latest version of PHP.

Vulnerability Insight

When PHP is used in a CGI-based setup (such as Apache's mod_cgid), the php-cgi receives a processed query string parameter as command line arguments which allows command-line switches, such as -s, -d or -c to be passed to the php-cgi binary, which can be exploited to disclose source code and obtain arbitrary code execution.

An example of the -s command, allowing an attacker to view the source code of index.php is below:

<http://example.com/index.php?-s>

Vulnerability Detection Method

Details: PHP-CGI-based setups vulnerability when parsing query string parameters from ph.

High (CVSS: 7.5)

NVT: Test HTTP dangerous methods

Summary

Misconfigured web servers allows remote clients to perform dangerous HTTP methods such as PUT and DELETE. This script checks if they are enabled and can be misused to upload or delete files.

Vulnerability Detection Result

We could upload the following files via the PUT method at this web server:

<http://10.0.2.4/dav/puttest260305920.html>

We could delete the following files via the DELETE method at this web server:

<http://10.0.2.4/dav/puttest260305920.html>

Impact

- Enabled PUT method: This might allow an attacker to upload and run arbitrary code on this web server.
- Enabled DELETE method: This might allow an attacker to delete additional files on this web server.

Solution

Solution type: Mitigation

Use access restrictions to these dangerous HTTP methods or disable them completely.

Vulnerability Detection Method

Details: Test HTTP dangerous methods

High 5900/tcp

High (CVSS: 9.0)

NVT: VNC Brute Force Login

Summary

Try to log in with given passwords via VNC protocol.
--

Vulnerability Detection Result

It was possible to connect to the VNC server with the password: password
--

Solution

Solution type: Mitigation

Change the password to something hard to guess or enable password protection at all.
--

Vulnerability Insight

This script tries to authenticate to a VNC server with the passwords set in the password preference. It will also test and report if no authentication / password is required at all.

Note: Some VNC servers have a blacklisting scheme that blocks IP addresses after five unsuccessful connection attempts for a period of time. The script will abort the brute force attack if it encounters that it gets blocked.
--

Note as well that passwords can be max. 8 characters long.
--

Medium (CVSS: 4.3)

NVT: SSL/TLS: Report Weak Cipher Suites

Summary

This routine reports all Weak SSL/TLS cipher suites accepted by a service.

NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.

Vulnerability Detection Result

'Weak' cipher suites accepted by this service via the SSLv3 protocol:

TLS_RSA_WITH_RC4_128_SHA

'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:

...continues on next page ...

	... continued from previous page ...
TLS_RSA_WITH_RC4_128_SHA	
Solution	
Solution type: Mitigation	
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.	
Please see the references for more resources supporting you with this task.	
Vulnerability Insight	
These rules are applied for the evaluation of the cryptographic strength:	
- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808).	
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000).	
- 1024 bit RSA authentication is considered to be insecure and therefore as weak.	
- Any cipher considered to be secure for only the next 10 years is considered as medium	
- Any other cipher is considered as strong

Medium (CVSS: 4.3)
 NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.
Vulnerability Detection Result
In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Weak and Supported Ciphers' (OID: 1.3.6.1.4.1.25623.1.0.802067) NVT.

Impact

... continues on next page ...

<p>... continued from previous page ...</p> <p>An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.</p>
<p>Solution</p> <p>Solution type: Mitigation</p> <p>It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1+ protocols. Please see the references for more information.</p>

Medium (CVSS: 4.0) NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability
Summary The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).
Vulnerability Detection Result Server Temporary Key Size: 1024 bits
Impact ... continues on next page ...

... continued from previous page ...
An attacker might be able to decrypt the SSL/TLS communication offline.
Solution
Solution type: Workaround
Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).
For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.
Vulnerability Insight
The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.
Vulnerability Detection Method
Checks the DHE temporary public key size.
Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability →... OID:1.3.6.1.4.1.25623.1.0.106223 Version used: \$Revision: 12865 \$

<p>Medium (CVSS: 5.0) NVT: Check if Mailserver answer to VRFY and EXPN requests</p>

Summary

... continues on next page ...

... continued from previous page ...
The Mailserver on this host answers to VRFY and/or EXPN requests.
<p>Vulnerability Detection Result 'VRFY root' produces the following answer: 252 2.0.0 root</p>
<p>Solution Solution type: Workaround Disable VRFY and/or EXPN on your Mailserver. For postfix add 'disable_vrfy_command=yes' in 'main.cf'. For Sendmail add the option 'O PrivacyOptions=goaway'. It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.</p>
<p>Vulnerability Insight VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.</p>
<p>Vulnerability Detection Method Details: Check if Mailserver answer to VRFY and EXPN requests OID:1.3.6.1.4.1.25623.1.0.100072 Version used: \$Revision: 13470 \$</p>
<p>References Other: URL:http://cr.yp.to/smtp/vrfy.html</p>

Medium (CVSS: 4.3) NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)
Summary This host is prone to an information disclosure vulnerability.
Vulnerability Detection Result Vulnerability was detected according to the Vulnerability Detection Method.
Impact Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.
<p>Solution Solution type: Mitigation Possible Mitigations are: - Disable SSLv3 - Disable cipher suites supporting CBC cipher modes - Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+</p>
... continues on next page ...

... continued from previous page ...
<p>Vulnerability Insight The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code</p>
<p>Vulnerability Detection Method Evaluate previous collected information about this service. Details: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability . →.. OID:1.3.6.1.4.1.25623.1.0.802087 Version used: \$Revision: 11402 \$</p>

Medium (CVSS: 4.0) NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability
<p>Summary The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).</p>
<p>Vulnerability Detection Result Server Temporary Key Size: 1024 bits</p>
<p>Impact An attacker might be able to decrypt the SSL/TLS communication offline.</p>
<p>... continues on next page ...</p>

... continued from previous page ...

Solution

Solution type: Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.
--

Vulnerability Insight

The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method

Checks the DHE temporary public key size.

Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Medium 22/tcp

Medium (CVSS: 4.3) NVT: SSH Weak Encryption Algorithms Supported
<p>Summary The remote SSH server is configured to allow weak encryption algorithms.</p>
<p>Vulnerability Detection Result</p> <p>... continues on next page ...</p>

...continued from previous page ...

The following weak client-to-server encryption algorithms are supported by the r
←emote service:

3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se

The following weak server-to-client encryption algorithms are supported by the r
←emote service:

3des-cbc
aes128-cbc
aes192-cbc
aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
rijndael-cbc@lysator.liu.se

Solution

Solution type: Mitigation

Disable the weak encryption algorithms.

Vulnerability Insight

The ‘arcfour’ cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.

The ‘none’ algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.

A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method

Check if remote ssh service supports Arcfour, none or CBC ciphers.

Details: SSH Weak Encryption Algorithms Supported

NVT: Anonymous FTP Login Reporting

Summary

Reports if the remote FTP Server allows anonymous logins.

Vulnerability Detection Result

It was possible to login to the remote FTP service with the following anonymous
→account(s):

anonymous:anonymous@example.com

ftp:anonymous@example.com

Impact

Based on the files accessible via this anonymous FTP login and the permissions of this account
an attacker might be able to:

- gain access to sensitive files
- upload or delete files.

Solution

Solution type: Mitigation

If you do not want to share files, you should disable anonymous logins.

Vulnerability Insight

A host that provides an FTP service may additionally provide Anonymous FTP access as well.
Under this arrangement, users do not strictly need an account on the host. Instead the user
typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly
asked to send their email address as their password, little to no verification is actually performed
on the supplied data.

Vulnerability Detection Method

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary

The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Vulnerability Detection Result

The following input fields where identified (URL:input name):

http://10.0.2.4/phpMyAdmin/:pma_password

http://10.0.2.4/phpMyAdmin/?D=A:pma_password

<http://10.0.2.4/tikiwiki/tiki-install.php:pass>

<http://10.0.2.4/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword>

Impact

An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution

Solution type: Workaround

Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS

Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method

Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.

The script is currently checking the following:

- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'

CVE: CVE-2018-20212

Other:

URL:<https://seclists.org/fulldisclosure/2019/Jan/7>

URL:<http://twiki.org/cgi-bin/view/Codev/DownloadTWiki>

Medium (CVSS: 4.3)

NVT: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

Product detection result

cpe:/a:phpmyadmin:phpmyadmin:3.1.1

Detected by phpMyAdmin Detection (OID: 1.3.6.1.4.1.25623.1.0.900129)

Summary

The host is running phpMyAdmin and is prone to Cross-Site Scripting Vulnerability.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Solution

Solution type: WillNotFix

No known solution was made available for at least one year since the disclosure of this vulnerability. Likely none will be provided anymore. General solution options are to upgrade to a newer release, disable respective features, remove the product or replace the product by another one.

Affected Software/OS

phpMyAdmin version 3.3.8.1 and prior.

Vulnerability Insight

The flaw is caused by input validation errors in the 'error.php' script when processing crafted BBcode tags containing '@' characters, which could allow attackers to inject arbitrary HTML code within the error page and conduct phishing attacks.

Vulnerability Detection Method

Details: phpMyAdmin 'error.php' Cross Site Scripting Vulnerability

OID:1.3.6.1.4.1.25623.1.0.801660

Version used: \$Revision: 11553 \$

Product Detection Result

Product: cpe:/a:phpmyadmin:phpmyadmin:3.1.1

Method: phpMyAdmin Detection

OID: 1.3.6.1.4.1.25623.1.0.900129)

Medium (CVSS: 4.3)

NVT: Apache HTTP Server 'httpOnly' Cookie Information Disclosure Vulnerability

Summary

This host is running Apache HTTP Server and is prone to cookie information disclosure vulnerability.

Vulnerability Detection Result

Vulnerability was detected according to the Vulnerability Detection Method.

Impact

Successful exploitation will allow attackers to obtain sensitive information that may aid in further attacks.

Solution

Solution type: VendorFix

Upgrade to Apache HTTP Server version 2.2.22 or later.

Affected Software/OS

Apache HTTP Server versions 2.2.0 through 2.2.21

Vulnerability Insight

The flaw is due to an error within the default error response for status code 400 when no custom ErrorDocument is configured, which can be exploited to expose 'httpOnly' cookies.

Medium 5900/tcp

Medium (CVSS: 4.8) NVT: VNC Server Unencrypted Data Transmission
Summary The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.
Vulnerability Detection Result The VNC server provides the following insecure or cryptographically weak Security Type(s): →y 2 (VNC authentication)
Impact An attacker can uncover sensitive data by sniffing traffic to the VNC server.
Solution Solution type: Mitigation Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.
Vulnerability Detection Method Details: VNC Server Unencrypted Data Transmission OID:1.3.6.1.4.1.25623.1.0.108529 Version used: \$Revision: 13014 \$

Low 22/tcp

Low (CVSS: 2.6)

NVT: SSH Weak MAC Algorithms Supported

Summary

The remote SSH server is configured to allow weak MD5 and/or 96-bit MAC algorithms.

Vulnerability Detection Result

The following weak client-to-server MAC algorithms are supported by the remote service:

hmac-md5

hmac-md5-96

hmac-sha1-96

The following weak server-to-client MAC algorithms are supported by the remote service:

hmac-md5

hmac-md5-96

hmac-sha1-96

Solution

Solution type: Mitigation

Disable the weak MAC algorithms.

Low general/tcp

Low (CVSS: 2.6)

NVT: TCP timestamps

... continues on next page ...

	... continued from previous page ...
Summary	The remote host implements TCP timestamps and therefore allows to compute the uptime.
Vulnerability Detection Result	<p>It was detected that the host implements RFC1323.</p> <p>The following timestamps were retrieved with a delay of 1 seconds in-between:</p> <p>Packet 1: 430540 Packet 2: 430650</p>
Impact	A side effect of this feature is that the uptime of the remote host can sometimes be computed.
Solution	<p>Solution type: Mitigation</p> <p>To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.</p> <p>To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled. The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.</p> <p>See the references for more information.</p>
Affected Software/OS	TCP/IPv4 implementations that implement RFC1323.
Vulnerability Insight	The remote host implements TCP timestamps, as defined by RFC1323.
Vulnerability Detection Method	<p>Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.</p> <p>Details: TCP timestamps OID:1.3.6.1.4.1.25623.1.0.80091 Version used: \$Revision: 14310 \$</p>
